Package 'ergm.ego'

June 21, 2021

```
Version 0.9.0
Date 2021-06-21
Title Fit, Simulate and Diagnose Exponential-
     Family Random Graph Models to Egocentrically Sampled Network Data
Depends R (>= 2.10),
     ergm (>= 4.0.0),
     egor,
     network (>= 1.17.1)
LinkingTo ergm
Imports statnet.common (>= 4.5.0),
     coda (>= 0.19.2),
     RColorBrewer (>= 1.1.2),
     purrr (>= 0.3.2),
     tibble (>= 2.1.1),
     dplyr,
     survey,
     stats,
     methods
Suggests testthat (>= 2.1.1),
     covr (>= 3.2.1)
Description Utilities for managing egocentrically sampled network data and a wrap-
     per around the 'ergm' package to facilitate ERGM inference and simula-
     tion from such data. See Krivitsky and Morris (2017) <doi:10.1214/16-AOAS1010>.

 $\star.svystat$

A scalar multiplication method for svystat

Description

Multiply the values of survey statistics by a specified vector elementwise, adjusting the variance.

Usage

```
## S3 method for class 'svystat' x * y
```

Arguments

x an object of class [svystat][survey::svymean].

y a numeric vector equal in length to x; shorter vectors will be recycled.

Value

a [svystat][survey::svymean] object with the updated statistics and variance-covariance matrix.

as.egor.egodata 3

Examples

```
library(survey)
data(api)
# From example(svymean):
dclus1<-svydesign(id=~dnum, weights=~pw, data=apiclus1, fpc=~fpc)

(m1 <- svymean(~api99, dclus1))
(v1 <- vcov(m1))

# Scale the suvery stat object by a factor of two:
(m2 <- m1 * 2)
(v2 <- vcov(m2))</pre>
```

as.egor.egodata

Convert (deprecated) egodata Objects to egor Objects

Description

Convert (deprecated) egodata Objects to egor Objects

Usage

```
## $3 method for class 'egodata'
as.egor(x, ...)
as_egor.egodata(x, ...)
```

Arguments

```
x a egodata object... additional arguments, currently unused.
```

Value

An egor object.

Author(s)

Pavel N. Krivitsky

4 as.egor.network

as.egor.network

Construct an Egocentric View of a network Object

Description

Given a network object, construct an egor object representing a census of all the actors in the network. Used mainly for testing.

Usage

```
## S3 method for class 'network'
as.egor(x, special.cols = c("na"), ...)
```

Arguments

x A network object.

special.cols Vertex attributes that should not be copied to the egos and alters tables. De-

faults to attributes special to the network objects.

... Additional arguments, currently unused.

Value

An egor object.

Author(s)

Pavel N. Krivitsky

See Also

template_network, which performs the inverse operation (though drops the ties).

```
# See example(ergm.ego) and example(template_network).
```

control.ergm.ego 5

control.ergm.ego

Control parameters for ergm. ego.

Description

Constructs and checks the list of control parameters for estimation by ergm. ego.

Usage

```
control.ergm.ego(
  ppopsize = c("auto", "samp", "pop"),
  ppopsize.mul = 1,
  ppop.wt = c("round", "sample"),
  stats.wt = c("data", "ppop"),
  stats.est = c("survey", "asymptotic", "bootstrap", "jackknife", "naive"),
  boot.R = 10000,
  ignore.max.alters = FALSE,
  ergm = control.ergm(),
  ...
)
```

Arguments

ppopsize, ppopsize.mul

Parameters to determine the size $\left|N'\right|$ of the pseudopopulation network. ppopsize can be

"auto" If the popsize (|N|) argument is specified and is different from 1, as if "pop"; otherwise, as "samp".

"samp" set |N'| based on the sample size: $|N'| = |S| \times popsize.mul$

"pop" set |N'| based on the population size: $|N'| = |N| \times \text{popsize.mul}$

a number set |N'| directly (popsize.mul ignored)

a network **object** use the specified network as the pseudo-population network directly; use at your own risk

a data frame use the specified data frame as the pseudo-population; use at your own risk

The default is to use the same pseudopopulation size as the sample size, but, particularly if there are sampling weights in the data, it should be bigger.

Note that depending on ppop.wt, this may only be an approximate target specification, with the actual constructed pseudopopulation network being slightly bigger or smaller.

ppop.wt

Because each ego must be represented in the pseuodopopulation network an integral number of times, if the sample is weighted (or the target |N'| calculated from ppopsize and ppopsize.mul is not a multiple of the sample size), it may not be possible, for a finite |N'| to represent each ego exactly according to its relative weight, and ppop.wt controls how the fractional egos are allocated:

6 control.ergm.ego

"round" (default) Rather than treating ppopsize as a hard setting, calculate $|N'|w_i/w$. for each ego i and round it to the nearest integer. Then, the |N'| actually used will be the sum of these rounded frequencies.

"sample" Resample in proportion to w_i .

stats.wt

Weight assigned to each ego's contribution to the ERGM's sufficient statistic:

"data" (default) Use weights $|N'|w_i/w$ for each ego i as in the data.

"ppop" Use weights ultimately used in the pseudopopulation network.

stats.est, boot.R

Method to be used to estimate the ERGM's sufficient statistics and their variance:

"survey" Variance estimator returned by survey::svymean(), appropriate to the design of the dataset.

"asymptotic" Delta method, as derived by Krivitsky and Morris (2015), assuming the ego weights are sampled alongside the egos.

(**default**) Delta method, as derived by Krivitsky and Morris (2015), assuming the ego weights are sampled alongside the egos.

"bootstrap" Nonparametric bootstrap with bias correction, resampling egos, using R replications.

"jackknife" Jackknife with bias correction.

"naive" "Naive" estimator, assuming that weights are fixed.

ignore.max.alters

if TRUE, ignores any constraints on the number of nominations.

ergm Control parameters for the ergm call to fit the model, constructed by control.ergm.

... Not used at this time.

Value

A list with arguments as components.

See Also

control.ergm

```
control.simulate.ergm.ego

Control parameters for simulate.ergm.ego.
```

Description

Constructs and checks the list of control parameters for simulation by simulate.ergm.ego.

Usage

```
control.simulate.ergm.ego(
  ppop.wt = c("round", "sample"),
  SAN = control.san(),
  simulate = control.simulate(),
  ...
)
```

Arguments

ppop.wt

Because each ego must be represented in the pseuodopopulation network an integral number of times, if the sample is weighted (or the target |N'| calculated from ppopsize and ppopsize mul is not a multiple of the sample size), it may not be possible, for a finite |N'| to represent each ego exactly according to its relative weight, and ppop wt controls how the fractional egos are allocated:

"round" (default) Rather than treating poposize as a hard setting, calculate $|N'|w_i/w$. for each ego i and round it to the nearest integer. Then, the |N'| actually used will be the sum of these rounded frequencies.

"sample" Resample in proportion to w_i .

SAN

A list of control parameters for san constructed by control.ergm, called to construct a pseudopopulation network consistent with the data.

simulate

A list of control parameters for simulate. formula constructed by control. simulate, called to simulate from the model fit.

Not used at this time.

Value

A list with arguments as components.

Pavel N. Krivitsky

8 degreedist.egor

See Also

control.simulate, control.san

degreedist.egor

Plotting the degree distribution of an egocentric dataset

Description

A degreedist() method for egodata objects: plot a histogram of the degree distribution of actors in the egocentric dataset, optionally broken down by group and/or compared with a Bernoulli graph.

Usage

```
## S3 method for class 'egor'
degreedist(
  object,
  freq = FALSE,
  prob = !freq,
  by = NULL,
  brgmod = FALSE,
  main = NULL,
  plot = brgmod,
  weight = TRUE,
   ...
)
```

Arguments

object	A egor object.
freq, prob	Whether to plot the raw frequencies or the conditional proportions of the degree values. Defaults to the latter.
by	A character vector giving the name of a vertex attribute; if given, plots the frequences broken down by that attribute.
brgmod	Plot the range of predicted frequencies/probabilities according to a Bernoulli graph having the same expected density as the observed.
main	Main title of the plot.
plot	Whether to plot the histogram; defaults to the same value asbrgmod, i.e., FALSE.
weight	Whether sampling weights should be incorporated into the calculation (TRUE, the default) or ignored (FALSE).
	Additional arguments to simulate.ergm.ego().

Value

Returns either a vector of degree frequencies/proportions if by=NULL or a matrix with a row for each category if not. If plot==TRUE returns invisibly.

ergm.ego 9

See Also

```
degreedist, summary
```

Examples

```
data(faux.mesa.high)
fmh.ego <- as.egor(faux.mesa.high)

degreedist(fmh.ego,by="Grade",brgmod=TRUE)
# Compare:
degreedist(faux.mesa.high)</pre>
```

ergm.ego

Inference for Exponential-Family Random Graph Models based on Egocentrically Sampled Data

Description

A wrapper around the ergm to fit an ERGM to an egor.

Usage

```
ergm.ego(
  formula,
  popsize = 1,
  offset.coef = NULL,
  constraints = ~.,
    ...,
  control = control.ergm.ego(),
  na.action = na.fail,
  na.rm = FALSE,
  do.fit = TRUE
)
```

Arguments

formula

An formula object, of the form e ~ <model terms>, where e is a egor object. See ergm for details and examples.

For a list of currently implemented egocentric terms for the RHS, see ergm. ego-terms.

popsize

The size |N| of the finite population network from which the egocentric sample was taken; only affects the shift in the coefficients of the terms modeling the overall propensity to have ties. Setting it to 1 (the default) essentially uses the $-\log |N'|$ offset on the edges term. Passing 0 disables network size adjustment and uses the egocentric sample size; passing I (N) uses the specified size N (though can be overridden by the ppop control.ergm.ego() option) and disables network size adjustment.

10 ergm.ego

offset.coef A vector of coefficients for the offset terms.

A one-sided formula formula giving the sample space constraints. See ergm for details and examples.

Additional arguments passed to ergm.

A control ergm.ego control list.

How to handle missing actor attributes in egos or alters, when the terms need them for models that scale.

How to handle missing actor attributes in egos or alters, when the terms need them for models that do not scale.

do.fit Whether to actually call ergm

Value

An object of class ergm.ego inheriting from ergm, with the following additional or overridden elements:

"v" Variance-covariance matrix of the estimate of the sufficient statistics

"m" Estimate of the sufficient statistics

"egor" The egor object passed

"popsize" Population network size used

"ppopsize" Pseudopopulation size used, see control.ergm.ego

"coef" The coefficients, along with the network size adjustment netsize.adj coeffi-

cient.

"covar" Pseudo-MLE estimate of the variance-covariance matrix of the parameter esti-

mates under repeated egocentric sampling

"ergm.covar" The variance-covariance matrix of parameter estimates under the ERGM super-

population process (without incorporating sampling).

"DtDe" Estimated Jacobian of the expectation of the sufficient statistics with respect to

the model parameters

ergm.ego-terms 11

Examples

ergm.ego-terms

ergm Terms Implemented for egor

Description

This page describes the ergm terms (and hence network statistics) for which inference based on egocentrically sampled data is implemented in ergm. ego package. Other packages may add their own terms. These functions should not be called by the end-user.

Details

The current recommendation for any package implementing additional egocentric calculator terms is to create a help file with a name or alias ergm.ego-terms, so that help("ergm.ego-terms") will list egocentric ERGM terms available from all loaded packages.

Currently implemented egocentric statistics

For each of these, please see their respective package's ergm-terms help for meaning and parameters. The simplest way to do this is usually via ? TERM.

Special-purpose terms: netsize.adj(edges=+1, mutual=0, transitiveties=0, cyclicalties=0) A special-purpose term equivalent to a linear combination of edges, mutual, transitiveties, and cyclicalties, to house the network-size adjustment offset. This term is added to the model automatically and should not be used in the model formula directly.

ergm:

- offset
- edges
- nodecov
- nodefactor
- nodematch

12 fmhfit

- nodemix
- absdiff
- degree
- degrange
- concurrent
- concurrentties
- degree1.5
- transitiveties
- cyclicalties
- esp
- gwesp
- gwdegree
- mm
- meandeg*

tergm: • mean.age*

Starred terms are *nonscaling*, in that while they can be evaluated, some inferential results and standard error calculation methods may not be applicable.

See Also

ergm-terms

fmhfit

Fitted ergm.ego model object

Description

This is an object with a fitted model to faux.mesa.high data using the code shown below in the Examples section.

Format

An object of class ergm. ego.

```
## Not run:
data(faux.mesa.high)
fmh.ego <- egor::as.egor(faux.mesa.high)
fmhfit <- ergm.ego(
  fmh.ego ~ edges + degree(0:3) +
      nodefactor("Race") + nodematch("Race")
  + nodefactor("Sex")+nodematch("Sex")
  + absdiff("Grade") + gwesp(0, fix=TRUE),
  popsize = network.size(faux.mesa.high),</pre>
```

gof.ergm.ego 13

```
control = control.ergm.ego(
    ergm = control.ergm(parallel=2)
)
)
## End(Not run)
```

gof.ergm.ego

Conduct Goodness-of-Fit Diagnostics on a Exponential Family Random Graph Model fit to Egocentrically Sampled Data

Description

gof.ergm.ego implements the gof method for ergm.ego fit objects.

An enhanced plotting method is also provided, giving uncertainty bars for the observed statistics as well.

Usage

```
## S3 method for class 'ergm.ego'
gof(
  object,
    ...,
  GOF = c("model", "degree", "espartners"),
  control = control.gof.ergm(),
  verbose = FALSE
)

## S3 method for class 'gof.ergm.ego'
plot(x, ..., ego.conf.level = 0.95)
```

Arguments

object	An ergm.ego fit.	
	Additional arguments. Unused by gof.ergm.ego(), passed to ergm::plot.gof() by plot.gof.ergm.ego()	
GOF	A string specifying the statistics whose goodness of fit is to be evaluated. Currently, only "degree", "espartners" and "model" are implemented; see gof documentation for details.	
control	$A\ list\ to\ control\ parameters,\ constructed\ using\ control\ .gof\ .formula\ or\ control\ .gof\ .ergm\ (which\ have\ different\ defaults).$	
verbose	Provide verbose information on the progress of the simulation.	
x	an object returned by gof.ergm.ego().	
ego.conf.level	confidence level for the observed statistic estimates as well.	

14 mixingmatrix.egor

Value

An object of class gof.ergm.ego, inheriting from gof.ergm.

Author(s)

Pavel N. Krivitsky

References

• David R. Hunter, Steven M. Goodreau, and Mark S. Handcock (2008). "Goodness of Fit of Social Network Models." *Journal of the American Statistical Association*, 103:481: 248–258. doi: 10.1198/016214507000000446

See Also

For examples, see ergm. ego.

Examples

mixingmatrix.egor

Summarizing the mixing among groups in an egocentric dataset

Description

A mixingmatrix method for egor objects, to return counts of how often a ego of each group nominates an alter of each group.

Usage

```
## S3 method for class 'egor'
mixingmatrix(object, attrname, rowprob = FALSE, weight = TRUE, ...)
```

nodal_attributes-API 15

Arguments

object	A egor object.
attrname	A character vector containing the name of the network attribute whose mixing matrix is wanted.
rowprob	Whether the counts should be normalized by row sums. That is, whether they should be proportions conditional on the ego's group.
weight	Whether sampling weights should be incorporated into the calculation (TRUE, the default) or ignored (FALSE).
	Additional arguments, currently unused.

Value

A matrix with a row and a column for each level of attrname.

Note that, unlike mixingmatrix, what is counted are *nominations*, not ties. This means that under an egocentric census, the diagonal of mixingmatrix.egor will be twice that returned by mixingmatrix for the original undirected network.

See Also

mixingmatrix, nodemix, summary method for egocentric data

Examples

```
data(faux.mesa.high)
fmh.ego <- as.egor(faux.mesa.high)

(mm <- mixingmatrix(faux.mesa.high,"Grade"))
(mm.ego <- mixingmatrix(fmh.ego,"Grade"))</pre>
```

nodal_attributes-API Helper functions for specifying nodal attribute levels

Description

These functions are meant to be used in EgoStat and other implementations to provide the user with a way to extract nodal attributes and select their levels in standardized and flexible ways. They are intended to parallel ergm::nodal_attributes-API of ergm package.

ergm.ego_get_vattr extracts and processes the specified nodal attribute vector. It is strongly recommended that check.ErgmTerm()'s corresponding vartype="function, formula, character"
(using the ERGM_VATTR_SPEC constant).

ergm.ego_attr_levels filters the levels of the attribute. It is strongly recommended that check.ErgmTerm()'s corresponding vartype="function, formula, character, numeric, logical, AsIs, NULL" (using the ERGM_LEVELS_SPEC constant).

16 nodal_attributes-API

Usage

```
ergm.ego_get_vattr(
 object,
 df,
 accept = "character",
 multiple = if (accept == "character") "paste" else "stop",
)
## S3 method for class 'character'
ergm.ego_get_vattr(
 object,
 df,
 accept = "character",
 multiple = if (accept == "character") "paste" else "stop",
)
## S3 method for class '`function`'
ergm.ego_get_vattr(
 object,
 df,
 accept = "character",
 multiple = if (accept == "character") "paste" else "stop",
)
## S3 method for class 'formula'
ergm.ego_get_vattr(
 object,
 df,
 accept = "character",
 multiple = if (accept == "character") "paste" else "stop",
)
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
## S3 method for class 'numeric'
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
## S3 method for class 'logical'
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
## S3 method for class 'AsIs'
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
## S3 method for class 'character'
```

17 nodal_attributes-API

```
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
## S3 method for class '`NULL`'
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
## S3 method for class 'matrix'
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
## S3 method for class '`function`'
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
## S3 method for class 'formula'
ergm.ego_attr_levels(object, attr, egor, levels = sort(unique(attr)), ...)
COLLAPSE_SMALLEST(object, n, into)
```

Arguments

object	An argument specifying the nodal attribute to select or which levels to include.
df	Table of egos or of alters.
accept	A character vector listing permitted data types for the output. See the Details section for the specification.
multiple	Handling of multiple attributes or matrix or data frame output. See the Details section for the specification.
•••	Additional argument to the functions of network or to the formula's environment.
attr	A vector of length equal to the number of nodes, specifying the attribute vector.
egor	An egor object.
levels	Starting set of levels to use; defaults to the sorted list of unique attributes.
n, into	see ergm::COLLAPSE_SMALLEST().

Details

The accept argument is meant to allow the user to quickly check whether the output is of an acceptable class or mode. Typically, if a term accepts a character (i.e., categorical) attribute, it will also accept a numeric one, treating each number as a category label. For this reason, the following outputs are defined:

[&]quot;character" Accept any mode or class (since it can beconverted to character).

[&]quot;numeric" Accept real, integer, or logical.

[&]quot;logical" Accept logical.

[&]quot;integer" Accept integer or logical.

[&]quot;natural" Accept a strictly positive integer.

[&]quot;Onatural" Accept a nonnegative integer or logical.

[&]quot;nonnegative" Accept a nonnegative number or logical.

18 predict.ergm.ego

```
"positive" Accept a strictly positive number or logical.
```

"paste" Paste together with dot as the separator.

Value

ergm.ego_get_vattr returns a vector of length equal to the number of nodes giving the selected attribute function. It may also have an attribute "name", which controls the suggested name of the attribute combination.

ergm.ego_attr_levels returns a vector of levels to use and their order.

Functions

• COLLAPSE_SMALLEST: A version of ergm::COLLAPSE_SMALLEST() that can handle both network and egodata objects.

Examples

```
data(florentine)
flomego <- as.egor(flomarriage)
ergm.ego_get_vattr("priorates", flomego)
ergm.ego_get_vattr(~priorates, flomego)
ergm.ego_get_vattr(c("wealth","priorates"), flomego)
ergm.ego_get_vattr(~priorates>30, flomego)
(a <- ergm.ego_get_vattr(~cut(priorates,c(-Inf,0,20,40,60,Inf),label=FALSE)-1, flomego))
ergm.ego_attr_levels(NULL, a, flomego)
ergm.ego_attr_levels(-1, a, flomego)
ergm.ego_attr_levels(1:2, a, flomego)
ergm.ego_attr_levels(1:2, a, flomego)</pre>
```

predict.ergm.ego

ERGM-based predicted tie probabilities for the pseudo-population network

Description

ERGM-based predicted tie probabilities for the pseudo-population network

Usage

```
## S3 method for class 'ergm.ego'
predict(object, ...)
```

Arguments

```
object model fit as returned by ergm.ego()
... other arguments passed to/from other methods
```

[&]quot;stop" Fail with an error message.

[&]quot;matrix" Construct and/or return a matrix whose rows correspond to vertices.

sample 19

Value

```
See ergm::predict.ergm()
```

sample

Draw random egocentric subsamples

Description

Implementations of the base::sample() function for egor::egor() data.

Usage

```
sample(x, size, replace = FALSE, prob = NULL, ...)
## Default S3 method:
sample(x, ...)
## S3 method for class 'egor'
sample(x, size, replace = FALSE, prob = NULL, ...)
```

Arguments

```
x, size, replace, prob
see base::sample().
... extra arguments, currently unused.
```

Value

An egor::egor() object whose egos have been resampled in accordance with the arguments. Note that its egor::ego_design() information is overwritten in favor of the selection probabilities used in the sampling.

Note

A reimplementation of sample as a generic was necessary because base::sample() is not a generic and cannot take data-frame-alikes as arguments.

```
data(faux.mesa.high)
fmh.ego <- as.egor(faux.mesa.high)

# Create a tiny weighted sample:
(s3 <- sample(fmh.ego, 3, replace=TRUE, prob=1:nrow(fmh.ego$ego)))
# Resampling with prob=weights(egor) creates a self-weighted
# sample:
(sample(s3, 3, replace=TRUE, prob=weights(s3)))</pre>
```

20 simulate.ergm.ego

simulate.ergm.ego

Simulate from a ergm. ego fit.

Description

A wrapper around simulate.formula to simulate networks from an ERGM fit using ergm.ego.

Usage

```
## S3 method for class 'ergm.ego'
simulate(
   object,
   nsim = 1,
   seed = NULL,
   constraints = object$constraints,
   popsize = if (object$popsize == 1 || object$popsize == 0 || is(object$popsize,
        "AsIs")) object$popsize else object$popsize,
   control = control.simulate.ergm.ego(),
   output = c("network", "stats", "edgelist", "pending_update_network", "ergm_state"),
   ...,
   verbose = FALSE
)
```

Arguments

object An ergm.ego fit.

nsim Number of realizations to simulate.

seed Random seed.

constraints, ...

Additional arguments passed to san and simulate. formula.

popsize Either network size to which to scale the model for simulation or a data. frame

with at least those ego attributes required to estimate the model, to simulate over

a specific set of actors.

simulate.ergm.ego 21

control A control.simulate.ergm.ego control list.

output one of "network", "stats", "edgelist", "pending_update_network", or,

for future compatibility, "ergm_state". See help for simulate.ergm() for

explanation.

verbose Verbosity of output.

Value

The ouput has the same format (with the same options) as simulate.formula. If output="stats" is passed, an additional attribute, "ppopsize" is set, giving the actual size of the network reconstructed, when the pop.wt control parameter is set to "round" and "popsize" is not a multiple of the egocentric sample size or the sampling weights.

snctrl

Statnet Control

Description

A utility to facilitate argument completion of control lists, reexported from statnet.common.

Currently recognised control parameters

This list is updated as packages are loaded and unloaded.

```

summary_formula.egor

Calculation of ERGM-style summary statistics for egor objects.

Description

Used to calculate the specified network statistics inferred from a egor object.

Usage

```
## S3 method for class 'egor'
summary_formula(object, ..., basis = NULL, individual = FALSE, scaleto = NULL)
## S3 method for class 'ergm.ego_svystat'
x * y
```

Arguments

object An ergm-style formula with a egor object as the LHS.

For a list of currently implemented egocentric terms for the RHS, see ergm. ego-terms.

... Not used at this time.

basis An optional egor object relative to which the statistics should be calculated.

individual If FALSE (the default), calculate the estimated per-capita statistics, weighted ac-

cording to the ego weights, then scale them up to a network of size scaleto. If TRUE, calculate each ego's individual contribution to the specified network

statistics.

scale to Size of a hypothetical network to which to scale the statistics. Defaults to the

number of egos in the dataset.

x, y see *.svystat.

Value

If individual==FALSE, an ergm.ego_svystat object, which is a subclass of svystat—effectively a named vector of statistics. If individual==TRUE, a matrix with a row for each ego, giving that ego's contribution to the network statistic.

Functions

 *.ergm.ego_svystat: A multiplication method that takes into account which statistics are scalable.

24 template_network

template_network	Construct an Empty "Template" Network Consistent with an Egocentric Sample

Description

Taking a egor object, constructs a network object with no edges whose vertices have the attributes of the egos in the dataset, replicating the egos as needed, and taking into accounts their sampling weights.

Usage

```
template_network(x, N, scaling = c("round", "sample"), ...)
```

Arguments

x A egor object.

N The target number of vertices the output network should have.

scaling If egor contains weights or N is not a multiple of number of egos in the sample,

it may not be possible, for a finite N to represent each ego exactly according to its relative weight, and scaling controls how the fractional egos are allocated:

"round" (the default) Rather than treating N as a hard setting, calculate Nw_i/w . for each ego i and round it to the nearest integer. Then, the N actually used will be the sum of these rounded frequencies.

"sample" Resample in proportion to w_i .

. . . Additional arguments, currently unused.

Value

A network object.
